1. INTRODUCTION

1.1 Project Understanding, Purpose, and Use

Further to your request, XCG Consulting Limited (XCG) is pleased to provide Cobric Chemicals Inc. (Cobric) and GFL Environmental Services Inc. (GFL) with our summary report for the Preliminary Hydrogeologic Baseline Study (Study) conducted by XCG at 237 Brant Street, Hamilton, Ontario (Facility). Refer to the site location map shown on Figure 1.

It is understood that Cobric and GFL have proposed the construction of an Electric Arc Furnace Dust (EAFD) recycling operation at the Facility and are in the process of completing an Environmental Screening Review (ESR) as defined by Ontario Regulation (O. Reg.) 101/07 – Waste Management Projects under the Environmental Assessment Act. It is XCG's understanding that the Study has been undertaken to support the ESR. The purpose of the Study is to determine the baseline groundwater characteristics/chemistry, to provide analysis on how the EAFD recycling Facility could impact current groundwater conditions, and to develop a long-term monitoring plan for implementation once the EAFD recycling Facility is operational.

This document provides a summary of the Study, including the field activities and methods, findings of the investigation, sample analytical results, and a comparison to current Ministry Standards.

1.2 Assessment Criteria

The environmental conditions on the subject site have been compared to the generic site condition standards (SCS) published by the Ministry of the Environment (MOE, or the Ministry¹) in the document “Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the *Environmental Protection Act*,” dated April 15, 2011 (MOE SCS).

Based on the site location, current and proposed future land use, the MOE SCS for industrial/community/commercial (ICC) land uses in a non-potable groundwater situation (i.e., MOE Table 3 SCS) will be used for assessment purposes.

1.3 Scope of Work

To achieve the project objectives, XCG completed the following scope of work:

Desktop Study

- Review of site activities and features to inform potential areas of concern and contaminants of concern (COCs).
- Review of published hydrogeologic features of the subject site and surrounding area.

¹ Previously known as the MOE, the Ministry of the Environment and Energy (MOEE), and the Ministry of the Environment and Climate Change (MOECC). Currently known as the Ministry of the Environment, Conservation and Parks (MECP).

- Review of surface water drainage features, storm sewer connections, and outflow locations.

Field Study

- XCG coordinated the mobilization and demobilization of all personnel and equipment required to complete the work. Prior to the subsurface investigations, public and private utility locates were completed in all of the areas where subsurface work was conducted.
- Advancement of six boreholes on the subject site to investigate soil stratigraphy and current soil conditions. The boreholes were completed to depths ranging from 6.1 to 7.6 metres below ground surface (mbgs).
- Instrumentation of each of the six boreholes as monitoring wells, to investigate the current groundwater quality.
- Collection of soil samples from each borehole location and field screening for evidence of impacts, including staining, odours, and the presence of total organic vapours (TOVs), which were measured using a handheld gas meter (e.g., RKI Eagle portable gas detector).
- Development and collection of groundwater samples from all newly installed groundwater monitoring wells.
- Submission of select soil samples from each borehole for chemical analysis of one or more of petroleum hydrocarbons (PHCs) (Fractions F1 to F4), volatile organic compounds (VOCs), polycyclic aromatic hydrocarbons (PAHs), and metals. One ‘worst case’ soil sample and one deeper sample were collected. One field duplicate soil sample was also collected.
- Submission of groundwater samples for chemical analysis of PHCs (F1 to F4), VOCs, PAHs, and metals from each monitoring well including one field duplicate sample.
- Surveyed the new monitoring wells, and measurement of the depth to groundwater for confirmation of the inferred direction of shallow groundwater flow.
- Collection of a composite soil sample from the soil cuttings created during the drilling activities and submission for leachate analysis using the toxicity characteristic leaching procedure (TCLP) for waste characterization and appropriate soil cuttings drums disposal after the investigations (undertaken by GFL internal resources).
- Review and assessment of field and analytical data.
- The described sampling program was conducted in general accordance with the MOE sampling protocols, including quality assurance and quality control (QA/QC) methods, as described in the MOE document, “Guide for Completing Phase Two Environmental Site Assessments under Ontario Regulation 153/04,” dated June 2011 and in the MOE document “Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the

Environmental Protection Act," dated March 9, 2004, amended as of July 1, 2011 (Analytical Protocol).

2. HYDROGEOLOGICAL SETTING

A review of available literature and databases was carried out prior to the initiation of site work to determine the general geological, hydrogeological, and physiographic characteristics of the study area. Soil, bedrock, groundwater, and topographic information were obtained from various sources such as MECP water well records, various Ontario Geological Survey mapping studies, Source Water Protection (SWP) studies, and the Hamilton Conservation Authority (HCA) website.

2.1 Regional Setting

2.1.1 Regional Physiography

The Facility is located within the physiographic region known as the Iroquois Plain, which occupies most of the Niagara Peninsula that lies north of the Niagara Escarpment. The Iroquois Plain can generally be described as beach deposits formed along lake shoreline and lacustrine plain extending to Lake Ontario which represents lake bottom sediments smoothed by wave action. A map of the regional physiography is provided in Attachment A.

2.1.2 Regional Geology and Hydrogeology

The surficial geology in the vicinity of the Facility comprises two units, described as follows:

- Unit 1-Modern alluvial deposits of clay, silt, sand and gravel; and,
- Unit 2-Coarse-textured glaciolacustrine deposits of sand, gravel, gravel, minor silt and clay.

The surficial geology mapping shown on Figure 2 was produced from the Ontario Geological Survey (OGS) Miscellaneous Release- Data (MRD) 128-Rev, dated 2010. Figure 2 depicts most of the surficial geology within the Facility boundaries being comprised of Unit 2. However, direct observations made by XCG during borehole drilling and soil sampling activities suggest the surficial geology of the Facility in the areas of investigation was comprised of clay soil best corresponding to Unit 1 described above.

Based on the available bedrock geology mapping provided by the OGS MRD126-Rev1, dated 2011, the bedrock geology underlying the Facility can be described as shale, limestone, dolostone and siltstone belonging to the Queenston Formation. A map of the regional bedrock geology is provided in Attachment B.

The regional water table elevation and inferred direction of groundwater flow are shown on the map provided in Attachment C. The direction of shallow (water table) groundwater flow is inferred to be to the north, in the general direction of Hamilton Harbour, which is located about 650 metres north of the Facility.

2.1.3 Existing Water Records

Water Well Records (WWR) were obtained online from the MECP database and reviewed and summarized to assess the wells located within approximately 500 m of the Facility. A tabulated summary of these WWR is provided in Attachment D.

Twenty-nine WWR were identified as being located within 500 m of the Facility, none of which were identified to be within the property boundaries of the Facility. The locations of these WWR are shown on Figure 3.

Of the 29 WWR reviewed, four were identified as being used for supply wells, twelve did not describe any well use, and the remainder were identified as observation/monitoring wells or test holes.

With respect to the supply wells noted above, based on the Facility's urban setting and their dates of installation (1962 or earlier), it is considered unlikely that any of these supply wells are still active, and so they are not considered a concern with respect to future development plans.

2.2 Site Setting

2.2.1 Site Servicing

The Facility is located in an urbanized area of Hamilton and is fully serviced by municipal water supply and sewers. Plan drawings showing Site Servicing and Site Grading are provided in Attachment E.

As shown on these plan drawings, various underground utilities are present immediately offset from the north, south, east, and west property boundaries.

The on-site storm water services comprise a series of catch basins and sewers which collect and direct the storm water across the Facility generally in a westerly direction towards Birch Avenue, where they connect to the municipal storm sewer system.

Paved surfaces within the Facility are sloped such that surface flow is directed towards the series of storm water catch basins.

2.2.2 Local Topography

The topography in the central and eastern portions of the Facility is relatively flat, with a moderate westerly slope toward Birch Avenue in the western area of the Facility.

As shown on the monitoring well logs in Attachment F, the surface elevation across the Facility ranges from a high of 79.3 metres above mean sea level (m asl) in the east area of the Facility, to a low of 76.8 m asl at the west property boundary near Birch Avenue.

2.2.3 Local Geology and Hydrogeology

Based on the observations made during the borehole advancement and monitoring well installations undertaken by XCG, the general subsurface stratigraphy consists of the following units (top to bottom):

- *Asphalt* layer ranging from approximately 0.05 m to 0.10 m thick.

- **Granular Fill** consisting mainly of sand and gravel, greyish in colour, with occasional asphalt and brick debris, and some field evidence of petroleum hydrocarbons. The thickness of this unit varied from approximately 0.5 m to 2.0 m.
- **Native Clay**, with trace silt, glaciolacustrine in origin, having medium to high plasticity, light to grey colour, and exhibiting no field evidence of impacts. This unit extended to the maximum depth of the borehole advancement (7.6 m).
- **Bedrock** was not encountered in any of the boreholes advanced by XCG as part of the Study. However, WWR 6804369, located approximately 100 metres south of the Facility, indicates that the base of the native clay and the top of the bedrock coincide at approximately 15 mbgs.

The monitoring well locations installed as part of the preliminary hydrogeologic baseline study are shown on Figure 4. The property boundaries as shown on Figure 4 are based on those shown on the Site Grading Plan provided in Attachment E. However, the west property boundary near monitoring well MW1 does not appear to extend to the full limit of the asphalt-covered (in use) area, suggesting the property boundary as shown may not be current, and may need to be updated.

Geologic cross sections shown on Figure 5A and Figure 5B were developed using the recently collected borehole information, as well as information provided in the WWR.

3. INVESTIGATION METHODS

3.1 General

Prior to commencing on-site drilling activities, all public utility services were cleared by Ontario One Call members. XCG also retained Landshark Locates to clear all work areas on the Facility for any private underground utilities.

The sampling program was conducted in general accordance with the Ministry sampling protocols, including QA/QC methods, as described in the Ministry document “*Guide for Completing Phase Two ESAs under Ontario Regulation* (O. Reg.) 153/04,” dated June 2011. All chemical analyses were performed in accordance with O. Reg. 153/04 (as amended), and specifically, the related document entitled *Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act, March 2004 (amended as of July 1, 2011)*.

XCG’s review of site activities and features did not identify any particular or anomalous areas of concerns, other than the main building itself. The investigative (monitoring well) locations were selected primarily to provide coverage near the property boundaries to confirm if contaminants have entered the subsurface from historical activities and if there is potential for impacted groundwater to migrate off-site.

The compounds selected for chemical analyses (PHC, VOC, PAH, and metals) were selected based on historic and planned activities undertaken at the Facility, as well as to assess for potential impacts associated with local fill materials.

3.2 Drilling

A total of six new boreholes (MW1, MW2, MW3, MW4, MW5 and MW6) were drilled on the Facility on May 5 and May 6, 2022. All six boreholes were installed as groundwater monitoring wells, identified as MW1, MW2, MW3, MW4, MW5, and MW6.

All boreholes were drilled by Aardvark Drilling Inc. of Guelph, Ontario (Aardvark). Aardvark is a MECP-licensed drilling contractor. The drilling activities were observed by representatives of XCG.

All six new boreholes were advanced using a CME-75 track-mounted drilling rig equipped with split spoon samplers and hollow-stem augers to a maximum depth of 7.6 mbgs (25 feet).

The approximate locations of the boreholes (monitoring wells) are shown on Figure 4. Borehole logs completed for the above-mentioned newly installed monitoring wells are provided in Attachment F.

3.3 Soil Sampling

During the advancement of the six new boreholes using the CME-75 truck-mounted drilling rig, soil samples were retrieved using 0.6-metre split-spoon samplers advanced at 0.76-metre intervals.

Soil samples collected from each borehole were logged for physical characteristics, as well as olfactory and visual evidence of contamination. Soil samples were collected in sealable plastic bags. Soil samples from each borehole were screened for visual and olfactory evidence of organic vapour using the headspace method using a calibrated RKI Eagle portable gas detector. Vapour measurements were taken from the headspace in the sample bags.

Two soil samples were submitted from each borehole and submitted for analysis of PHC (F1 to F4), PAH, VOC, and metals. At five of the locations (MW2 through MW6), one sample each was submitted from the granular fill and the underlying native clay. At MW1, two samples of the native clay were submitted for analysis.

The granular fill samples were submitted for analysis because they were considered to be “worst-case” based on field observations, while the samples of the underlying native clay were submitted for analysis to verify that any impacts present in the granular fill did not extend downward into the native clay.

All soil samples were logged for geologic detail and recorded on XCG standard stratigraphic log forms.

3.4 *Groundwater Monitoring Well Installation*

As described in Section 3.2, the drilling activities were completed by Aardvark using a CME-75 truck-mounted drilling rig. Following the completion of drilling and soil sampling activities, all six new boreholes were instrumented as monitoring wells and identified as MW1 through MW6.

All newly installed monitoring wells were constructed using 51-millimetre (2-inch) diameter PVC Schedule 40 pipe, equipped with 10-slot, 3.0-metre-long screens. For each newly installed monitoring well, a clean silica sand filter pack was placed around the screen, extending approximately 0.15 metres to 0.3 metres above the top of the screen and a bentonite seal was placed above the filter packs to backfill the remaining borehole annulus. All newly installed monitoring wells were completed with a well cap and a protective casing set into a concrete collar at grade.

The monitoring well development activities at the newly installed monitoring wells were completed on May 13, 2022.

3.5 *Elevation Surveying*

The six newly advanced monitoring wells were surveyed by XCG on May 13, 2022 to establish reference elevations on the riser pipes (measuring points) and ground surface . The site datum (benchmark) used was the catch basin located adjacent to the south end of the weigh scale, having an elevation of 257 feet a msl (78.39 m amsl) provided on the Grading Plan provided in Attachment E.

The elevations were measured using a Topcon RC-H3A rotating laser level. The elevations of the ground surface and top of riser pipe (TOP) at each monitoring well location are shown in Table 1 and are also shown on the monitoring well logs.

3.6 Groundwater Monitoring and Sampling

The water levels at the six new monitoring wells were measured on May 13, 2022 and again on May 20, 2022. These water level measurements and corresponding elevations are summarized in Table 1.

The groundwater elevations measured on May 20, 2022 are presented as interpolated elevation contours on Figure 6.

The groundwater samples were collected on May 20, 2022. The samples were transferred directly into laboratory-prepared and supplied containers using dedicated sampling equipment. The samples were submitted under chain-of-custody protocol for laboratory analysis. All samples that were analyzed for dissolved metals were pre-filtered in the field using 0.45-micron disposable filters.

3.7 Analytical Testing

All soil and groundwater samples were submitted under chain of custody protocols to ALS Environmental (Waterloo) for analysis.

The soil and groundwater samples were analyzed for PHCs (F1 to F4), VOCs, PAHs, and metals. These analytes were chosen to provide a baseline of the groundwater and soil quality at the Facility.

The laboratory certificates of analysis are provided in Appendix G.

3.8 Quality Assurance and Quality Control Measures

All groundwater sample containers were prepared and supplied by the laboratory performing the analysis. The sample containers for each suite of parameters were prepared as required by laboratory protocols.

The laboratory QA/QC program included laboratory replicates, method blanks, matrix spikes and surrogate percent recoveries.

All sample containers were labelled with all required information, including preservation, sample identification, company identification, project identification, date and time of sample collection, and requested analysis. Following the sample collection, all samples were placed in a cooler with icepacks to maintain a temperature less than 10 degrees Celsius. All samples were submitted using chain of custody protocols to the laboratory for analysis.

4. RESULTS

4.1 Monitoring Well Details

The monitoring wells installed as part of the study consisted of the following:

- Six monitoring wells (MW1 through MW6) were installed at depths ranging from 6.1 mbgs to 7.6 mbgs.
- All the monitoring wells were constructed with 50 mm diameter, 3.1 metre length slotted PVC well screens, which were installed entirely within the native clay soil.
- The water levels observed on May 20, 2022, ranged from approximately 1.5 to 6.5 mbgs.

Monitoring well instrumentation logs are provided in Attachment F, and the monitoring well locations are shown on Figure 4.

4.2 Water Level Monitoring

Groundwater levels were measured at the newly installed monitoring wells on May 13, 2022 and May 20, 2022. These measurements and resultant groundwater elevations are summarized in Table 1.

As noted above, the groundwater depths measured at the newly installed monitoring wells ranged from approximately 1.5 mbgs to 6.5 mbgs.

The groundwater elevations at the monitoring wells and the interpolated elevation contours are shown on Figure 6, using measurements collected on May 20, 2022. The inferred direction of local shallow (water table) groundwater flow is generally to the west/southwest, as indicated by the flow direction arrows on the figure.

As described Section 2.1.2, on a regional scale the direction of shallow groundwater flow is inferred to flow in a northerly direction toward Hamilton Harbour. The observed discrepancy between the groundwater flow direction observed locally (Figure 6) and regionally (Attachment C) is likely due the local buried utilities interfering with the natural flow of groundwater, or possibly localized topographic effects.

4.3 Groundwater Quality

The groundwater analytical results are provided in Tables 2 to 5, attached, and are summarized as follows:

PHCs: As shown in Table 2, there were no exceedances of the MOE Table 3 generic SCS for PHCs (F1-F4) in any of the groundwater samples from any of the monitoring wells. There were no PHC compounds detected above the laboratory reportable detection limit (RDL) in any of the samples.

Metals: As shown in Table 3, there were no exceedances of the MOE Table 3 generic SCS for metals in any of the samples.

PAHs: As shown in Table 4, there were no exceedances of the MOE Table 3 generic SCS for PAHs detected in any of the samples from any of the monitoring wells.

VOCs: As shown in Table 5, no VOCs were detected in any of the samples from any of the monitoring wells, other than a low-level detection of chloroform at monitoring well MW1.

4.4 Soil Quality

The soil analytical results are provided in Tables 6 to 9, attached, and are summarized as follows:

PHCs: As shown in Table 5, there were no exceedances of the MOE Table 3 generic SCS for PHCs (F1-F4) in any of the analyzed soil samples.

Metals: As shown in Table 5, there were exceedances of the MOE Table 3 generic SCS for at least two metals parameters, specifically cadmium, lead and zinc, in the samples of the shallow granular fill collected at MW2, MW3, MW4, MW5, and MW6. There were no metals exceedances in any of the samples collected from the deeper native clay soil.

PAHs: As shown in Table 4, there were no exceedances of the MOE Table 3 generic SCS for PAHs detected in any of the samples from any of the monitoring wells.

VOCs: As shown in Table 5, no VOCs were detected in any of the soil samples (granular fill or native clay) from any of the monitoring wells.

5. LIMITATIONS, CONCLUSIONS AND RECOMMENDATIONS

5.1 Limitations

The scope of this report is limited to the matters expressly covered. This report was prepared for the sole benefit of Cobric Chemicals Inc. and GFL Environmental Services Inc. in support of the proposed construction of an Electric Arc Furnace Dust recycling operation at the Facility.

This report may not be relied upon by any other person or entity. Any use or reuse of this document (or the findings and conclusions represented herein), by parties other than those listed above, is at the sole risk of those parties.

The conclusions drawn were based on information collected during the preliminary hydrogeological assessment. Conditions between and beyond these locations may become apparent, during future investigations or on-site work, which could not be detected or anticipated at the time of this investigation. As such, XCG cannot be held responsible for environmental conditions that were not apparent from the available information.

5.2 Conclusions

The overall conclusions of the preliminary hydrogeological study are as follows:

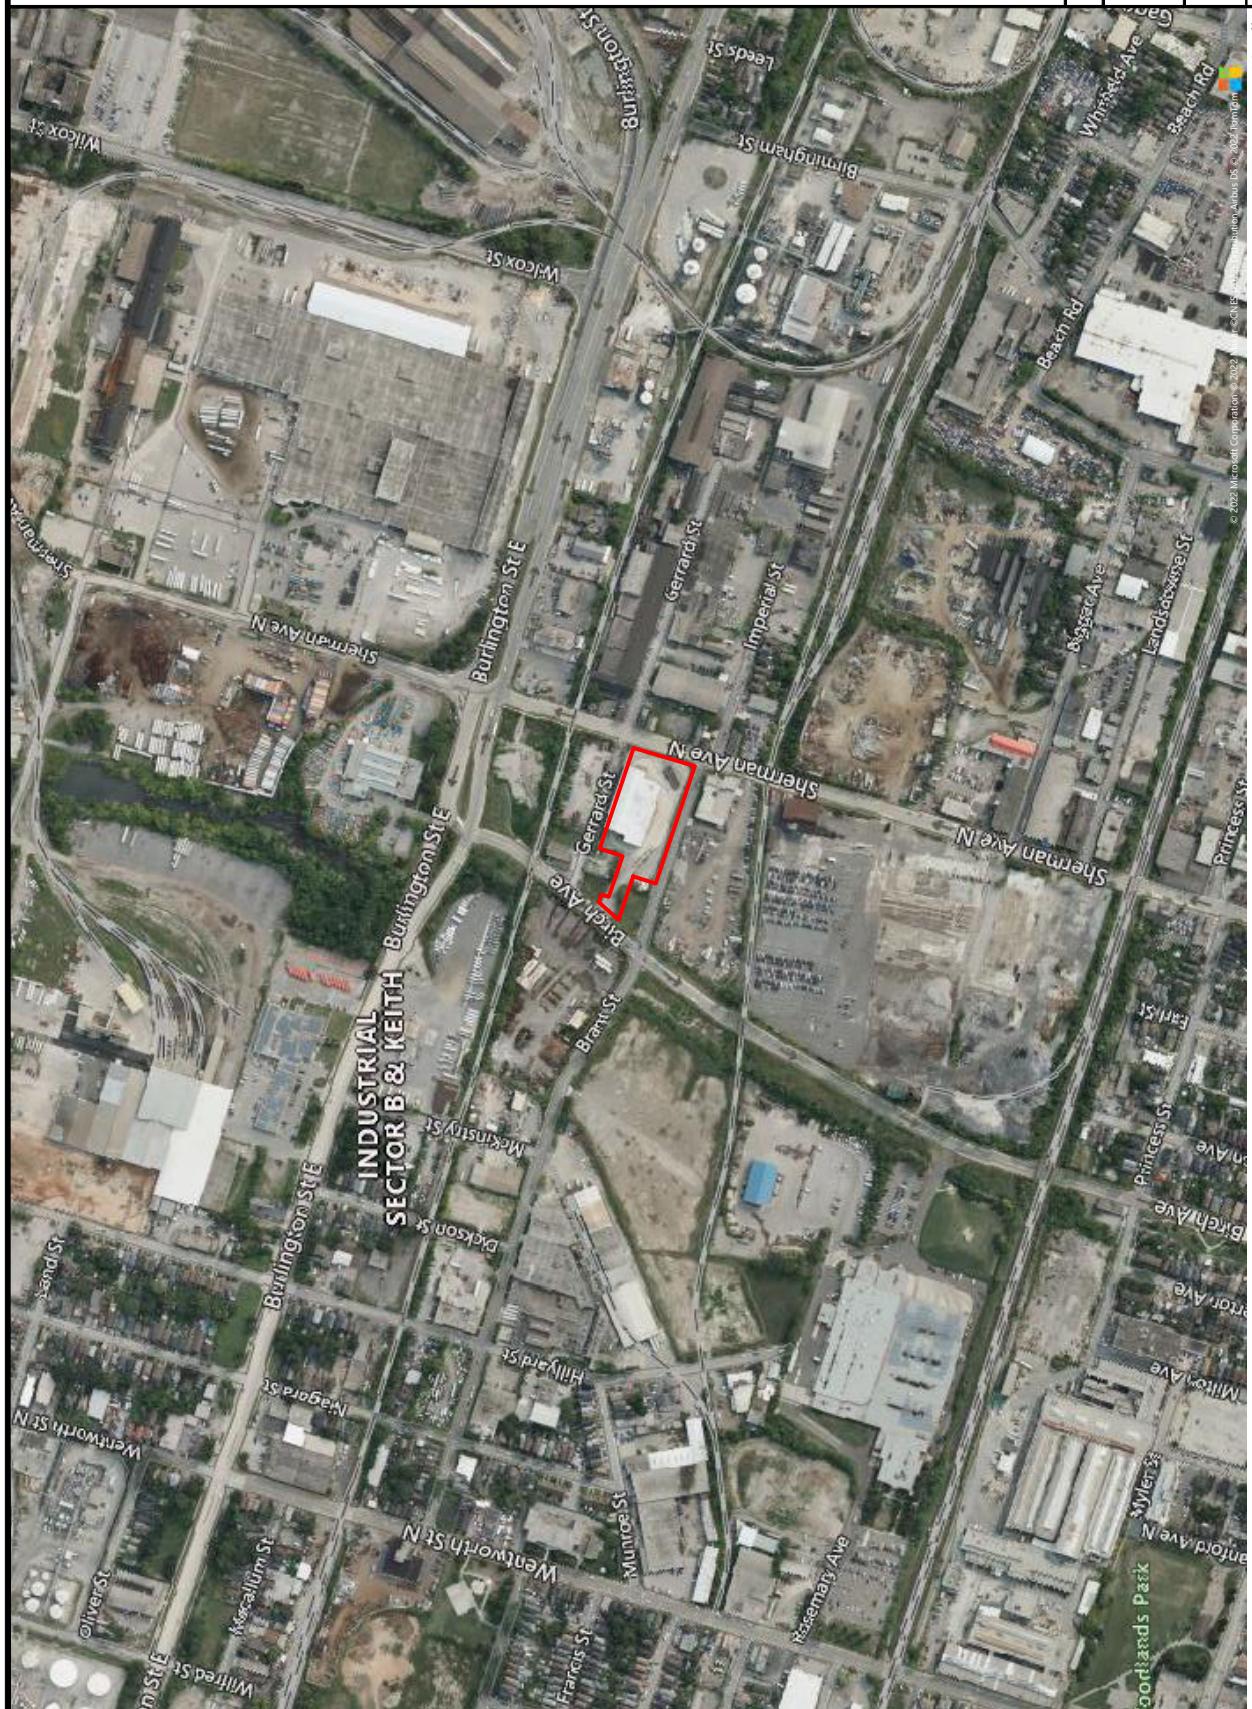

- The Facility is underlain by a layer of granular fill material with a thickness ranging from approximately 0.5 m to 2.0 m.
- Underlying the granular fill material is a native clay, with a confirmed depth of occurrence of at least 7.6 mbgs.
- The available information suggests the base of the native clay and the bedrock surface coincide at approximately 15 mbgs in the area of the Facility.
- The regional shallow groundwater reportedly flows in a northerly direction.
- The local shallow groundwater is inferred to flow to the west/southwest in the immediate area of the Facility. Buried utilities may be locally disrupting the natural flow of groundwater.
- The recent groundwater analytical results from May 2022 indicate that the groundwater quality at the newly installed monitoring wells (MW1 through MW6) did not exceed any of the MOE Table 3 generic SCS for PHC, VOC, PAH, or metals.
- The recent soil analytical results from May 2022 indicate that the granular fill underlying the Facility contains concentrations of metals (cadmium, lead, zinc) which exceed the respective MOE Table 3 generic SCS.
- The recent soil analytical results from May 2022 indicate that the native clay did not exceed any MOE Table 3 generic SCS for PHC, VOC, PAH, or metals.

CERTIFICATE OF ANALYSIS

Work Order	: WT2203520
Client	: XCG Consulting Limited
Contact	: Michael Schriver
Address	: 820 Trillium Drive Kitchener ON Canada N2R 1K4
Telephone	: 519 741 5774
Project	: 5-5030-01-02
PO	: ----
C-O-C number	: ----
Sampler	: CLIENT
Site	: ----
Quote number	: Gold 2022 SOA
No. of samples received	: 16
No. of samples analysed	: 13

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Laboratory Department

Position	Signature	Comments
Department Manager - Microbiology and Prep	Amanda Ganouri-Lumsden	Centralized Prep. Waterloo, Ontario
Supervisor - Inorganic	Greg Pokocky	Metals, Waterloo, Ontario
Team Leader - Semi-Volatile Instrumentation	Jeremy Gingras	Organics, Waterloo, Ontario
Department Manager - Semi-Volatile Organics	Jocelyn Kennedy	Organics, Waterloo, Ontario
Team Leader - Volatiles	Sarah Birch	Organics, Waterloo, Ontario

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	Description
-	No Unit
%	percent
mg/kg	milligrams per kilogram

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: WT2203520	Page	: 1 of 16
Client	: XCG Consulting Limited	Laboratory	: Waterloo - Environmental
Contact	: Michael Schriver	Account Manager	: Andrew Martin
Address	: 820 Trillium Drive Kitchener ON Canada N2R 1K4	Address	: 60 Northland Road, Unit 1 Waterloo, Ontario Canada N2V 2B8
Telephone	: 519 741 5774	Telephone	: +1 519 886 6910
Project	: 5-5030-01-02	Date Samples Received	: 06-May-2022 15:45
PO	: ---	Issue Date	: 17-May-2022 11:41
C-O-C number	: ---		
Sampler	: CLIENT		
Site	: ---		
Quote number	: Gold 2022 SOA		
No. of samples received	: 16		
No. of samples analysed	: 13		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.

DQO: Data Quality Objective.

LOR: Limit of Reporting (detection limit).

RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "—" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Matrix Spike outliers occur.

- Laboratory Control Sample (LCS) outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers occur - please see following pages for full details.

Outliers : Quality Control Samples
Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: Soil/Solid

	02							

Result Qualifiers

Qualifier Description

MES

Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: Soil/Solid

Quality Control Sample Type	Analytical Methods	Method	QC Lot #	Count			Frequency (%)		
				QC	Regular	Actual	Expected	Evaluation	
Laboratory Duplicates (DUP)									
CCME PHC - F1 by Headspace GC-FID		E581.F1	481086	2	32	6.2	5.0	✓	
CCME PHCs - F4G by Gravimetry (Low Level)		E601.F4G-L	489612	0	4	0.0	5.0	✗

CCME PHCs - F4G by Gravimetry (Low Level)		E601.F4G-L	489612	0	4	0.0	5.0	✗	
CCME PHCs - F2-F4 by GC-FID (Low Level)		E601.SG-L	481075	2	13	15.3	5.0	✓	
PAHs by MeOH:ToI GC-MS		E642F	480934	1	13	7.6	5.0	✓	
VOCs (ON List) by Headspace GC-MS		E611D	481085	2	32	6.2	5.0	✓	

Evaluation: ✗ = QC frequency outside specification; ✓ = QC frequency within specification.

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by 'mod').

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Moisture Content by Gravimetry	E144	Soil/Solid	CCME PHC in Soil - Tier 1	Moisture is measured gravimetrically by drying the sample at 105°C. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of the sample, expressed as a percentage.
Metals in Soil/Solid by CRC ICPMS	E440	Soil/Solid	EPA 6020B (mod)	This method is intended to liberate metals that may be environmentally available. Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl.
CCME PHC - F1 by Headspace GC-FID	E681.F1	Soil/Solid	CCME PHC in Soil - Tier 1	Dependent on sample matrix, some metals may be only partially recovered, including Al, Ba, Be, Cr, Sr, Ti, V, W, and Zr. Silicate minerals are not solubilized. Volatile forms of sulfur (including sulfide) may not be captured, as they may be lost during sampling, storage, or digestion. This method does not adequately recover elemental sulfur, and is unsuitable for assessment of elemental sulfur standards or guidelines.
CCME PHCs - F4G by Gravimetry (Low Level)	E601.F4G-L	Soil/Solid	CCME PHC in Soil - Tier 1	Analysis is by Collision/Reaction Cell ICPOES.
CCME PHCs - F2-F4 by GC-FID (Low Level)	E601.SG-L	Soil/Solid	CCME PHC in Soil - Tier 1	CCME Fraction 1 (F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
VOCs (ON List) by Headspace GC-MS	E611D	Soil/Solid	EPA 8260D (mod)	A portion of the silica gel treated sample extract is filtered and dried at 105°C and the mass of the residual gravimetric heavy hydrocarbons (F4G) is determined gravimetrically.
PAHs by MeOH:Tol GC-MS	E642F	Soil/Solid	EPA 8270E (mod)	Sample extracts are subjected to in-situ silica gel treatment prior to analysis by GC-FID for CCME hydrocarbon fractions (F2-F4).
F1-BTEX	EC580	Soil/Solid	CCME PHC in Soil - Tier 1	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
				Polycyclic Aromatic Hydrocarbons (PAHs) are extracted with methanol/toluene and analyzed by GC-MS. If reported, IACR (index of additive cancer risk, unitless) and B(a)P toxic potency equivalent (in soil concentration units) are calculated as per CCME PAH Soil Quality Guidelines fact sheet (2010) or ABT1.

Method / Lab	Matrix	Method Reference	Method Descriptions
Sum F1 to F4 (C6-C50)	Soil/Solid	CCME PHC in Soil - Tier 1	Hydrocarbons, total (C6-C50) is the sum of CCME Fractions F1(C6-C10), F2(C10-C16), F3(C16-C34), and F4(C34-C50). F4G-sg is not used within this calculation due to overlap with other fractions.
Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Metals and Mercury	Soil/Solid	EPA 200.2 (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl. This method is intended to liberate metals that may be environmentally available.
VOCs Methanol Extraction for Headspace Analysis	Soil/Solid	EPA 5035A (mod)	VOCs in samples are extracted with methanol. Extracts are then prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PHCs and PAHs Hexane-Acetone Tumbler Extraction	Soil/Solid	CCME PHC in Soil - Tier 1 (mod)	Samples are subsampled and Petroleum Hydrocarbons (PHC) and PAHs are extracted with 1:1 hexane:acetone using a rotary extractor.
Pesticides, PCB, PAH, and Neutral Extractable Chlorinated Hydrocarbons Extraction (High Level)	Soil/Solid	EPA 3570 (mod)	A homogenized subsample is extracted with organic solvents using a mechanical shaker.

QUALITY CONTROL REPORT

Client	: XCG Consulting Limited	Laboratory	: Waterloo - Environmental
Contact	: Michael Schriever	Account Manager	: Andrew Martin
Address	: 820 Trillium Drive Kitchener ON Canada N2R 1K4	Address	: 60 Northland Road, Unit 1 Waterloo, Ontario Canada N2V 2B8
Telephone	: 519 741 5774	Telephone	: +1 519 886 6910
Project	: 5-5030-01-02	Date Samples Received	: 06-May-2022 15:45
PO	: ---	Date Analysis Commenced	: 08-May-2022
C-O-C number	: ---	Issue Date	: 17-May-2022 11:41
Sampler	: CLIENT		
Site	: ---		
Quote number	: Gold 2022 SOA		
No. of samples received	: 16		
No. of samples analysed	: 13		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full. This Quality Control Report contains the following information.

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatures

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories

Signatories	Position	Laboratory Department

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percent Difference

= Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "--" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: Soil/Solid

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: Soil/Solid

Analyte	CAS Number	Method	LOR	Unit	Laboratory Control Sample (LCS) Report			Qualifier

Qualifiers

Qualifier

Description

Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OM OE & CCME).

MES

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

This Certificate of Analysis contains the following information:

- General Comments
 - Analytical Results
 - Guideline Comparison
- Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).**

Signatures

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	Position	Laboratory Department
Greg Pokocky	Supervisor - Inorganic	Metals, Waterloo, Ontario
Jeremy Gingras	Team Leader - Semi-Volatile Instrumentation	Organics, Waterloo, Ontario
Jocelyn Kennedy	Department Manager - Semi-Volatile Organics	Organics, Waterloo, Ontario
Sarah Birch	Team Leader - Volatiles	Organics, Waterloo, Ontario

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to fitness for a particular purpose, or non-infringement. ALS assumes no responsibility for errors or omissions in the information. Guidelines are not adjusted for the hardness, pH or temperature of the sample (the most conservative values are used). Measurement uncertainty is not applied to test results prior to comparison with specified criteria values.

Key :
LOR: Limit of Reporting (detection limit).

Unit	Description
-	No Unit

µg/L
micrograms per litre

>: greater than.

<: less than.

Red shading is applied where the result is greater than the Guideline Upper Limit or the result is lower than the Guideline Lower Limit.

For drinking water samples, Red shading is applied where the result for E.coli, fecal or total coliforms is greater than or equal to the Guideline Upper Limit.

Qualifiers

Qualifier	Description
DLQ	Detection Limit raised due to co-eluting interference. GCMS qualifier ion ratio did not meet acceptance criteria.

Dissolved Metals							
antimony, dissolved	E421	0.10	µg/L	0.26	20000 µg/L		
arsenic, dissolved	E421	0.10	µg/L	1.04	1900 µg/L		
barium, dissolved	E421	0.10	µg/L	116	29000 µg/L		
beryllium, dissolved	E421	0.020	µg/L	<0.020	67 µg/L		
boron, dissolved	E421	10	µg/L	54	450000 µg/L		
cadmium, dissolved	E421	0.0050	µg/L	0.0094	2.7 µg/L		
chromium, dissolved	E421	0.50	µg/L	<0.50	810 µg/L		
cobalt, dissolved	E421	0.10	µg/L	0.56	66 µg/L		
copper, dissolved	E421	0.20	µg/L	0.86	87 µg/L		
lead, dissolved	E421	0.050	µg/L	0.052	25 µg/L		
mercury, dissolved	E509	0.0050	µg/L	<0.0050	0.29 µg/L		
molybdenum, dissolved	E421	0.050	µg/L	4.81	9200 µg/L		
nickel, dissolved	E421	0.50	µg/L	6.28	490 µg/L		
selenium, dissolved	E421	0.050	µg/L	0.339	63 µg/L		
silver, dissolved	E421	0.010	µg/L	<0.010	1.5 µg/L		
sodium, dissolved	E421	50	µg/L	102000	2300000 µg/L		
thallium, dissolved	E421	0.010	µg/L	0.029	510 µg/L		
uranium, dissolved	E421	0.010	µg/L	4.50	420 µg/L		
vanadium, dissolved	E421	0.50	µg/L	1.04	250 µg/L		
zinc, dissolved	E421	1.0	µg/L	<1.0	1100 µg/L		
dissolved mercury filtration location	EP509	-		Field			
dissolved metals filtration location	EP421	-		Field			
Speciated Metals							
chromium, hexavalent [Cr VI], dissolved	E532A	0.50	µg/L	<0.50			
Volatile Organic Compounds							
acetone	E611D	20	µg/L	<20	130000 µg/L		
benzene	E611D	0.50	µg/L	<0.50	44 µg/L		
bromodichloromethane	E611D	0.50	µg/L	<0.50	85000 µg/L		

Analyte	Method	LOR	Unit	WT2204232-007 (Continued)	ON153/04 T3-NPGW-C-AI 1
Volatile Organic Compounds - Continued					
bromoform	E611D	0.50	µg/L	<0.50	380 µg/L
bromomethane	E611D	0.50	µg/L	<0.50	5.6 µg/L
carbon tetrachloride	E611D	0.20	µg/L	<0.20	0.79 µg/L
chlorobenzene	E611D	0.50	µg/L	<0.50	630 µg/L
chloroform	E611D	0.50	µg/L	<0.50	2.4 µg/L
dibromochloromethane	E611D	0.50	µg/L	<0.50	82000 µg/L
dibromoethane, 1,2-	E611D	0.20	µg/L	<0.20	0.25 µg/L
dichlorobenzene, 1,2-	E611D	0.50	µg/L	<0.50	4600 µg/L
dichlorobenzene, 1,3-	E611D	0.50	µg/L	<0.50	9600 µg/L
dichlorobenzene, 1,4-	E611D	0.50	µg/L	<0.50	8 µg/L
dichlorodifluoromethane	E611D	0.50	µg/L	<0.50	4400 µg/L
dichloroethane, 1,1-	E611D	0.50	µg/L	<0.50	320 µg/L
dichloroethane, 1,2-	E611D	0.50	µg/L	<0.50	1.6 µg/L
dichloroethylene, 1,1-	E611D	0.50	µg/L	<0.50	1.6 µg/L
dichloroethylene, cis-1,2-	E611D	0.50	µg/L	<0.50	1.6 µg/L
dichloroethylene, trans-1,2-	E611D	0.50	µg/L	<0.50	1.6 µg/L
dichloromethane	E611D	1.0	µg/L	<1.0	610 µg/L
dichloropropane, 1,2-	E611D	0.50	µg/L	<0.50	16 µg/L
dichloropropylene, cis-trans-1,3-	E611D	0.50	µg/L	<0.50	5.2 µg/L
dichloropropylene, cis-1,3-	E611D	0.30	µg/L	<0.30	
dichloropropylene, trans-1,3-	E611D	0.30	µg/L	<0.30	
ethylbenzene	E611D	0.50	µg/L	<0.50	2300 µg/L
hexane, n-	E611D	0.50	µg/L	<0.50	51 µg/L
methyl ethyl ketone [MEK]	E611D	20	µg/L	<20	470000 µg/L
methyl isobutyl ketone [MIBK]	E611D	20	µg/L	<20	140000 µg/L
methy-tert-butyl ether [MTBE]	E611D	0.50	µg/L	<0.50	190 µg/L
styrene	E611D	0.50	µg/L	<0.50	1300 µg/L
tetrachloroethane, 1,1,1,2-	E611D	0.50	µg/L	<0.50	3.3 µg/L
tetrachloroethane, 1,1,2,2-	E611D	0.50	µg/L	<0.50	3.2 µg/L
tetrachloroethylene	E611D	0.50	µg/L	<0.50	1.6 µg/L
toluene	E611D	0.50	µg/L	<0.50	18000 µg/L
trichloroethane, 1,1,1-	E611D	0.50	µg/L	<0.50	640 µg/L
trichloroethane, 1,1,2-	E611D	0.50	µg/L	<0.50	4.7 µg/L
